

CGRM7006 Collaborator Manual

Project operating guide for teammates and partner AI agents

1. Project Goal

The group is not doing a plain replication. The chosen design uses the published paper as a validated backbone, then extends it into a course-fit question about climate-poverty traps. The practical objective is to deliver a poster and short presentation that show both technical competence and a clear policy-oriented research question.

- Main narrative: warming raises poverty and inequality, but the burden is concentrated in vulnerable places.
- Current validated extension: agriculture dependence amplifies the warming effect.
- Preferred final upgrade: add governance or adaptive-capacity moderation and a hotspot targeting figure.

2. Chosen Research Design

- Research Question 1: Does annual warming increase subnational extreme poverty and inequality?
- Research Question 2: Are the effects stronger in agriculture-dependent contexts?
- Research Question 3: Can the final poster identify climate-poverty trap locations for policy targeting?

This design is stronger than 'same paper, newer year' because the core poverty panel does not currently extend beyond 2022. The project therefore creates originality through a sharper question and a more policy-relevant framing, not by pretending newer annual observations exist in the same panel.

3. Dataset Roles

Dataset	Role in project	Current status
Dataverse / SPID panel	Main regression backbone	Local and validated
Paper PDF and source workbooks	Reference results and figure logic	Local and validated
GSAP 2023	Later-stage hotspot map or poverty atlas layer	Candidate supplement
WGI / ND-GAIN	Governance or readiness moderation	Candidate supplement

4. What Has Already Been Validated

Result	Estimate	Interpretation
Temp -> extreme poverty	0.629	Positive and statistically significant
Temp -> Gini inequality	0.463	Positive and statistically significant
Temp x high agriculture -> poverty	1.404	Amplification effect is significant
Temp x high agriculture -> Gini	0.956	Amplification effect is significant

5. Remaining Work

- Produce one governance or readiness moderation result if recent official data can be merged cleanly.
- Generate one map-grade visual for the final poster.
- Condense the regression evidence into one main table and two strong figures for the poster.
- Write the final poster text in a concise style aligned with the template sections.
- Build the five-slide lightning presentation from the same evidence base.

6. Team Division of Work

- Analysis lead: owns Stata scripts, dataset merges, and result validation logs.
- Writing lead: owns poster wording, introduction, methods, discussion, and slide script.
- Design lead: owns poster template population, chart selection, and visual consistency.
- QA lead or second agent: cross-checks numbers, citations, and figure labels against logs.

7. File and Evidence Rules

- Raw inputs stay in D:/CGRM7006_Group and should not be reorganized.
- All new scripts, drafts, and outputs stay under d:/VibeCoding/codex/reports/cgrm7006_group.
- Every material action should be logged in docs/DEV_LOG.md.
- No result should be treated as final unless it is backed by a log, generated file, or direct code reference.

8. Blocking Issue

GitHub deployment is currently blocked by invalid GitHub CLI credentials on this machine. This does not block local writing, chart generation, or PDF creation, but it does block the requested online publication of assets. Once authentication is restored, the local asset folder can be uploaded without regenerating the PDFs.
